

Contents

1	Linear Algebra	1
1.1	Vectors and Linear Spaces	1
1.1.1	Subspaces	2
1.1.2	Length, Distance, and Alignment	2
1.1.3	Linear Independence and Bases	4
1.2	Linear Operators and Matrices	5
1.2.1	Addition and Multiplication of Matrices	6
1.2.2	Transpose and Adjoint	8
1.2.3	Einstein Summation Convention	9
1.2.4	Gram-Schmidt Orthogonalization and the QR Decomposition	10
1.2.5	The Outer Product, Dyads, and Projection Operators	11
1.2.6	Partitioned Matrices and Matrix Operations	12
1.3	Systems of Linear Algebraic Equations	14
1.3.1	Introduction to Existence and Uniqueness	14
1.3.2	Solving $Ax = b$: LU Decomposition	16
1.3.3	The Determinant	18
1.3.4	Rank of a Matrix	19
1.3.5	Range Space and Null Space of a Matrix	20
1.3.6	Existence and Uniqueness in Terms of Rank and Null Space	22
1.3.7	Least-Squares Solution	22
1.3.8	Minimum Norm Solution	27
1.3.9	Rank, Nullity, and the Buckingham Pi Theorem	28
1.3.10	Nonlinear Algebraic Equations: the Newton-Raphson Method	30
1.3.11	Linear Coordinate Transformations	33
1.4	The Algebraic Eigenvalue Problem	33
1.4.1	Introduction	33
1.4.2	Self-Adjoint Matrices	35
1.4.3	General (Square) Matrices	37
1.4.4	Positive Definite Matrices	41
1.4.5	Eigenvalues, Eigenvectors, and Coordinate Transformations	42

1.4.6	Schur Decomposition	46
1.4.7	Singular Value Decomposition	48
1.5	Functions of Matrices	52
1.5.1	Polynomial and Exponential	52
1.5.2	Optimizing Quadratic Functions	57
1.5.3	Vec Operator and Kronecker Product of Matrices	63
1.6	Exercises	69
2	Ordinary Differential Equations	97
2.1	Introduction	97
2.2	First-Order Linear Systems	98
2.2.1	Superposition Principle for Linear Differential Equations	98
2.2.2	Homogeneous Linear Systems with Constant Coefficients	99
2.2.3	Qualitative Dynamics of Planar Systems	102
2.2.4	Laplace Transform Methods for Solving the Inhomogeneous Constant-Coefficient Problem	104
2.2.5	Delta Function	110
2.3	Linear Equations with Variable Coefficients	112
2.3.1	Introduction	112
2.3.2	The Cauchy-Euler Equation	113
2.3.3	Series Solutions and the Method of Frobenius	114
2.4	Function Spaces and Differential Operators	118
2.4.1	Functions as Vectors	118
2.4.2	Self-Adjoint Differential Operators and Sturm-Liouville Equations	126
2.4.3	Existence and Uniqueness of Solutions	133
2.5	Lyapunov Functions and Stability	145
2.5.1	Types of Stability	145
2.5.2	Lyapunov Functions	148
2.5.3	Application to Linear Systems	153
2.5.4	Discrete Time Systems	155
2.6	Asymptotic Analysis and Perturbation Methods	158
2.6.1	Introduction	158
2.6.2	Series Approximations: Convergence, Asymptoticness, Uniformity	158
2.6.3	Scaling, and Regular and Singular Perturbations	162
2.6.4	Regular Perturbation Analysis of an ODE	165
2.6.5	Matched Asymptotic Expansions	166

2.6.6	Method of Multiple Scales	174
2.7	Qualitative Dynamics of Nonlinear Initial-Value Problems	179
2.7.1	Introduction	179
2.7.2	Invariant Subspaces and Manifolds	179
2.7.3	Some Special Nonlinear Systems	183
2.7.4	Long-Time Behavior and Attractors	187
2.7.5	The Fundamental Local Bifurcations of Steady States	193
2.8	Numerical Solutions of Initial-Value Problems	200
2.8.1	Euler Methods: Accuracy and Stability	201
2.8.2	Stability, Accuracy, and Stiff Systems	204
2.8.3	Higher-Order Methods	204
2.9	Numerical Solutions of Boundary-Value Problems	208
2.9.1	The Method of Weighted Residuals	208
2.10	Exercises	220
3	Vector Calculus and Partial Differential Equations	253
3.1	Vector and Tensor Algebra	253
3.1.1	Introduction	253
3.1.2	Vectors in Three Physical Dimensions	253
3.2	Differential Operators and Integral Theorems	256
3.2.1	Divergence, Gradient, and Curl	256
3.2.2	The Gradient Operator in Non-Cartesian Coordinates	258
3.2.3	The Divergence Theorem	264
3.2.4	Further Integral Relations and Adjoints of Multidimensional Differential Operators	269
3.3	Linear Partial Differential Equations: Properties and Solution Techniques	271
3.3.1	Classification and Canonical Forms for Second-Order Partial Differential Equations	271
3.3.2	Separation of Variables and Eigenfunction Expansion with Equations involving ∇^2	272
3.3.3	Laplace's Equation, Spherical Harmonics, and the Hydrogen Atom	287
3.3.4	Applications of the Fourier Transform to PDEs	291
3.3.5	Green's Functions and Boundary-Value Problems	297
3.3.6	Characteristics and D'Alembert's Solution to the Wave Equation	305
3.3.7	Laplace Transform Methods	308

3.4	Numerical Solution of Initial-Boundary-Value Problems: Discretization and Numerical Stability	316
3.4.1	Numerical Stability Analysis for the Diffusion Equation	318
3.4.2	Numerical Stability Analysis for the Convection Equation	320
3.4.3	Operator Splitting for Convection-Diffusion Prob- lems	323
3.5	Exercises	325
4	Probability, Random Variables, and Estimation	347
4.1	Introduction and the Axioms of Probability	347
4.2	Random Variables and the Probability Density Function	349
4.3	Multivariate Density Functions	356
4.3.1	Multivariate normal density	358
4.3.2	Functions of random variables.	368
4.3.3	Statistical Independence and Correlation	370
4.4	Sampling	374
4.4.1	Linear Transformation	375
4.4.2	Sample Mean, Sample Variance, and Standard Error	379
4.5	Central Limit Theorems	381
4.5.1	Identically distributed random variables	383
4.5.2	Random variables with different distributions . .	386
4.5.3	Multidimensional central limit theorems	387
4.6	Conditional Density Function and Bayes's Theorem . . .	388
4.7	Maximum-Likelihood Estimation	392
4.7.1	Scalar Measurement y , Known Measurement Vari- ance σ	394
4.7.2	Scalar Measurement y , Unknown Measurement Variance σ	399
4.7.3	Vector of Measurements y , Different Parame- ters Corresponding to Different Measurements, Known Measurement Covariance R	404
4.7.4	Vector of Measurements y , Different Parame- ters Corresponding to Different Measurements, Unknown Measurement Covariance R	410
4.7.5	Vector of Measurements y , Same Parameters for all Measurements, Known Measurement Covari- ance R	412

4.7.6	Vector of Measurements y , Same Parameters for all Measurements, Unknown Measurement Covariance R	414
4.8	PCA and PLS regression	416
4.9	Appendix — Proof of the Central Limit Theorem	425
4.10	Exercises	430
5	Stochastic Models and Processes	455
5.1	Introduction	455
5.2	Stochastic Processes for Continuous Random Variables	456
5.2.1	Discrete Time Stochastic Processes	456
5.2.2	Wiener Process and Brownian Motion	459
5.2.3	Stochastic Differential Equations	463
5.2.4	Fokker-Planck Equation	470
5.3	Stochastic Kinetics	475
5.3.1	Introduction, and Length and Time Scales	475
5.3.2	Poisson Process	477
5.3.3	Stochastic Simulation	483
5.3.4	Master Equation of Chemical Kinetics	486
5.3.5	Microscopic, Mesoscopic, and Macroscopic Kinetic Models	492
5.4	Optimal Linear State Estimation	498
5.4.1	Introduction	498
5.4.2	Optimal Dynamic Estimator	501
5.4.3	Optimal Steady-State Estimator	506
5.4.4	Observability of a Linear System	508
5.4.5	Stability of an Optimal Estimator	511
5.5	Exercises	513
A	Mathematical Tables	528
A.1	Laplace Transform Table	528
A.2	Statistical Distributions	531
A.3	Vector and Matrix Derivatives	532
A.3.1	Derivatives: Other Conventions	536
A.4	Exercises	538
